## **TidySantCugat**

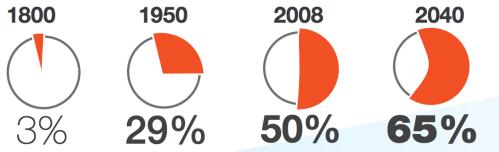

Cleaning the city with Big Data

#### The team

- Francesc Roca
- Adriana Freitas
- Guillermo Blasco

## The reality, and what is coming

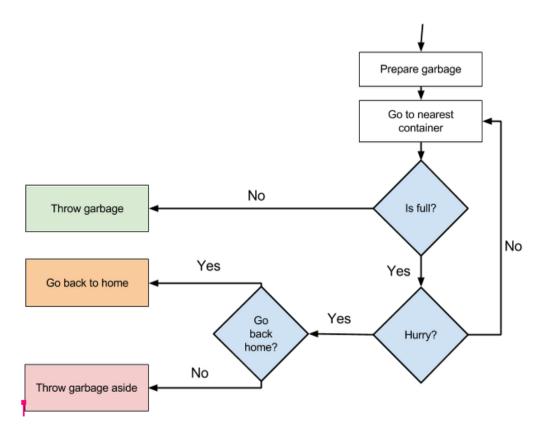

"The 19<sup>th</sup> century was a century of empires, the 20<sup>th</sup> century was a century of nation states. The 21<sup>st</sup>century will be a century of cities."

Wellington E. Webb, Former Mayor of Denver

## The user journey of garbage

## The problem of traditional way

Users do not know about garbage container status

Garbage Collectors still with rigid logistic plans

#### The Idea

Provide information of container status to users and administration as better as possible.

#### The Idea

Provide information of container status to users and administration as better as possible.

So the chance of the scenario for user "The garbage is full!" would be less frequent.

## Strategic advantages

- High rate of smartphone per citizen
- Democratization of geodata visualization
- Internet of Things applied to garbage collection industry

## **Product design**

The four magical phases of data products

- 1. What happened?
- 2. Why happened?
- 3. What shall happen?
- 4. What should do to success?

## Phase I, What happened?

- Notify users when the nearest container is full and empty
- Notify administration when the containers are full

## Phase II, Why happened that?

- Issues in the garbage collection plan → notify users
- Change of user's behaviour → modify collection plan

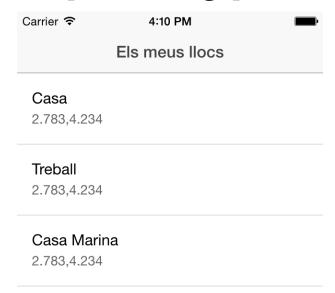

## Phase III, What shall happened?

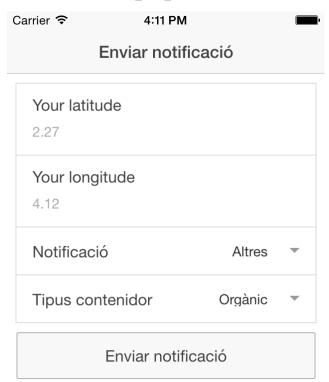

- Forecast the fill rate of containers → fill rate prediction for users
- Inform administration of the fill rate of all containers at future hours

# Phase IV, What should do to success?

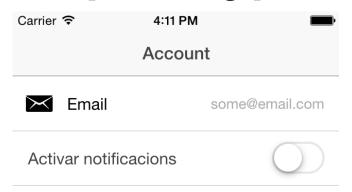

- Suggest users best moment for throw the garbage
- Automatic collection plan update

## The prototype: The mobile app

## The prototype: The mobile app

# The prototype: maps for visualization

#### Still more ideas

- What about companies?
- What about extending the product to other cities?
- What about add data integration process of sensors in the application?

## Thanks!
